

In our industrial engineering, a design is made for all devices, and here we want to design a robot in addition to pouring coffee from the robot to the customer. First, we will talk about the most important path, which is the path of artificial intelligence, which is to think about the robot's control mechanism from where a robot can move and pour coffee, the second path is electrical power And it works on the operation and movement of the hand by devices and personal control from the robot itself, and we also want to work on programming the hand to pour coffee in a small amount. To pour it, the fourth path is the Internet of Things, which is based on the speech of the robot and the voices of the robot and the response, and we want them to work on purifying the voice and thanking the customer.
